latis, margine saepe subplanis; foliis caulinis ramulisque mediis et superioribus alternis sublinearibus 1 mm. latis 1–2 cm. longis apice acutis margine revolutis; inflorescentia elongata dense thyrsoidea vel paniculata; floribus in axillis foliorum glomerulatis vel solitariis haud scorpioideis; calycibus fructiferis elongatis subsessilibus 4–5 mm. longis tarde deciduis; lobis calycis maturi linearibus in costa setis flavescentibus 2–3 mm. longis munitis et in marginibus dense ascendenter villosis; corolla inconspicua tubulosa 2–2.5 mm. longa ad anthesim calycem ca. 3 mm. longam vix superante; nuculis 4 homomorphis (nucula adaxillari subpersistenti?) triangulari-ovatis ca. 1.3 mm. longis ca. 0.9 mm. latis lucentibus, apice acutis, basi late truncatis, margine acutis minime incrassatis, dorso convexis prominenter papillatis, ventre obtuse angulatis sparse tuberculatis ¾ longitudinis ad gynobasim angustum ca. 1 mm. longam afixis sulco infra medium in areolam deltoideam abrupte dilatatis; stylo nuculas vix superante.

California: eight miles west of Chowchilla, Madera Co., a single colony in dry coarse sand, May 7, 1935, R. F. Hoover 558 (TYPE, Gray Herb.); Gobin Ranch, about 13 mi. east of Waterford, Stanislaus Co., in coarse sand on a flat among rolling hills, May 2, 1936, Hoover 1103 (G); sand hills east of Antioch, Contra Costa Co., April 16, 1908, Heller 8888 (G).

I can suggest no close relative for this very distinct species. The peculiar inflorescence, characterized by a complete lack of scorpioid cymes, is unique among the North American species of the genus. The nutlets though not aberrant are distinctive and I believe the species can be recognized from them alone. The corollas are very small and possibly may be cleistogamic though the corollas surmounting the ripening ovary have their tiny lobes expanded and not permanently closed as in the indubitably cleistogamic flowers of the South American section Eucryptantha.

I have associated with this unusual species the name of Mr. Robert F. Hoover of Modesto, Calif., to whom I am indebted for the excellent specimens here described. The material was collected by Mr. Hoover during botanical trips about the San Joaquin Valley made in furtherance of his study of the floristics of that region. It is a pleasure to associate his name with this remarkable addition to the known flora of that interesting area.

Cryptantha corollata (Johnston), comb. nov. C. decipiens var. corollata Johnston, Contr. Gray Herb. 74: 61 (1925); Johnston in Munz, Man. So. Calif. Bot. 428 (1935).

Since this plant of the drier inner Coast Ranges of California was first

distinguished over ten years ago I have seen many collections of it. Among the scores of specimens studied I have found none that give any indication that *C. corollata* and *C. decipiens* intergrade in any way, or that their geographical ranges overlap or even approach one another closely. The plant I distinguished as *corollata* is very constant and readily identifiable and has a range that is eminently natural. I now believe it should be given specific recognition.

Hackelia brachytuba (Diels), comb. nov. Paracaryum brachytubum Diels, Notes Royal Bot. Gard. Edinburgh 5: 168 (1912). Lappula Dielsii Brand in Fedde, Repert. 14: 147 (1915). Hackelia Dielsii (Brand) Johnston, Contr. Gray Herb. 68: 45 (1923).

The type of *P. brachytubum* came from the Tali Valley (*Forrest 4474*) that of *L. Dielsii* from the Likiang Range (*Forrest 2255*), also in Yunnan. They are evidently conspecific.

Trigonotis sericea (Maxim.), comb. nov. Omphalodes sericea Maximowicz, Bull. Acad. Sci. St. Pétersb. 17: 453; Mél. Biol. 8: 558 (1872).

This species is evidently a relative of T. Icumae (Maxim.) Makino, T. radicans Maxim. and T. myosotidea Maxim. and not a member of the genus Omphalodes as it has been accepted for so long.

Antiotrema Dunnianum (Diels) Handel-Mazzetti, Anzeiger Akad. Wiss. Wien 57: 239 (1920). Cynoglossum Dunnianum Diels, Notes Royal Bot. Gard. Edinburgh 5: 168 (1912). Cynoglossum Cavaleriei Léveillé in Fedde, Repert. 12: 534 (1913) and Cat. Seu-Tchouen, tab. 5 (1918). Henreyettana mirabilis Brand in Fedde, Repert. 26: 171 (1929).

The type of *C. Cavaleriei* (*Cavalerie 2117*) has its flowers at anthesis and shows no fruit. It is a mediocre specimen but one clearly conspecific with the type of *A. Dunnianum*. Léveillé had other collections of the species, *Bodinier 1579* and *2160*, which do possess mature fruit but these were not associated by him with his *C. Cavaleriei*. They are in fact the basis upon which he reported, *Bothriospermum Kusnezowii* from Kweichow, Fl. Kouy-Tchéou 52–53 (1914).

In his recent treatment of this remarkable plant, Handel-Mazzetti, Symb. Sin. 7:825 (1936), is incorrect in stating that the nutlets and embryo are "erect." As I have already indicated, Contr. Gray Herb. 75:44–45 (1925), the nutlets and embryos are in fact inverted in Antiotrema. This is a very unusual condition in the Boraginaceae and is found in only two other genera of the family.
